

## **Method and System for Multicasting Call Notifications**

### **ABSTRACT**

5        A method for communication over a network, which can be both analog and digital includes simultaneously transmitting a call notification to a plurality of communication devices. These communication devices include devices such as telephones, pagers, computers, and voice mail systems. The addresses (e.g., telephone numbers) are stored in a database which is queried based on the call  
10 notification. For example, this method can be used in a find-me/follow-me system or to initiate a conference call.
